V Kuralmani

*Institute of High Performance Computing*

For processes in a near zero-defect environment, many problems are encountered in the application of traditional statistical control charts. This book presents practical statistical models and techniques for the monitoring and control of high quality processes. The “cumulative count of conforming” chart has been shown to be useful in practice as it can also focus on quality improvement possibilities. This book is based on recent research on this important topic. Many examples, charts and procedures are presented throughout the book. Many references are provided for those interested in exploring the details. The book would serve as a useful reference for practitioners as well as students and researchers.
